

Changes

- Make parry and pull core two separate binds in the settings menu
- Make submenus (e.g.) settings use Erbaum bold rather than Sofachrome
- Keep sofachrome for main menu, headers, character names
- Reduce slide jump momentum boost by 20%
 - Add a ceiling to slide jump momentum boosts, so that you can't chain them over and over to go faster and faster.
 - Right now, if you do three slide jump boosts in a row you can zip down the whole field. For now, let's cap it at what the momentum is after you do two consecutive slide boosts. Let me change this in project settings
- The bullet tracer animation needs to come from the gun barrel, not above or behind it.
- Change in game colors of the blue and amber team to match the exact color hexes of the blue and amber from the main menu ui assets
- Change Oyster's E cooldown to reset everytime he poisons someone. The E jar's should explode once the pull animation finishes, rather than waiting for a jump to trigger them.
- Add a 2pixel white outline to the default button state (non-hover)
- Change the hands used in the first person view to the default unreal engine mannequin hands and animations, and socket the gun we modeled in
-

Sound effects:

- Add sound effects, which I will upload with this prompt
 - Some should be client side, some should be game-side
 - All the sounds are named based on what triggers them
 - Core Turnover, dash, and parry should be game-side
 - The rest should be client side
- Make sure it's easy to swap sound effects in and out for new versions
