

Bugs/errors:

- Important, first thing to deal with:
 - Fix drawn outside lethal and lethal outside drawn bug
 - Ensure that the trace shows exactly what is lethal
- Running build.bat for the newest version resulted in this error:
[3/10] Compile [x64] Module.Trace.2.cpp
C:\Users\ranen\trace\Source\Trace\Core\TracePlayerController.cpp(1598,25):
error C4459: declaration of 'LogInput' hides global declaration
if (IConsoleVariable* LogInput =
IConsoleManager::Get().FindConsoleVariable(TEXT("Trace.LogInput")))
^
C:\Program Files\Epic
Games\UE_5.8\Engine\Source\Runtime\InputCore\Classes\InputCoreTypes.h(11,
15): note: see declaration of 'LogInput'
INPUTCORE_API DECLARE_LOG_CATEGORY_EXTERN(LogInput, Log,
All);
- Check through the codebase for other common Unreal-reserved names being reused as local variables, to head off future errors before they interrupt a build, bc this has happened before.

Changes:

- Change game mode b to the default game mode
- Do not implement abilities or characters into what was game mode a (endzones)
- Create a menu for selecting a character when a player loads into a game of goals (was game mode b, is now the default mode)
- Do not allow players to select a character who has already been chosen by a player on their team
- Bots remain characterless, for now. They play the game the exact same way, as default mannequins with no abilities.
- Include a toggle in game settings to turn off all characters
- NO abilities damage carriers, carriers can still only be killed when an enemy dashes through their trace

Abilities:

- Each character has one movement ability, one passive ability, one activated ability
 - This is a starting point, with exceptions

- Character ability cooldowns should continue to countdown while a player is dead. They should not automatically reset due to death or a goal (a player can spawn with an ability timer still counting down). They should all reset at halftime.
- Default bind for character's activated abilities should be E
- All of this will need extensive tuning, the goal is to get a basis for different characters and abilities into the game
- Test each ability for possible bugs, test interactions between abilities

Rocco (character a)

- Rocco gains a 3% speed boost from headshot kills for 1second, stacking, each kill extends the timer on the entire boost (Passive)
- Has a very small second jump, which allows Rocco to change direction midair, instantly (Movement)
- Activated ability: Ripple
 - dash in any direction (separate cooldown from standard dash) this dash leaves a ripple behind. Any character may move into the start of the ripple, and the ripple will propel them along the path of the dash.
 - 20 second cooldown
 - Essentially, after Rocco uses their special second dash, any player (on either team), may run into the point where Rocco began the dash. They will then be propelled along the path of the dash (whether this is up, left, at a diagonal, etc).
 - The core carrier can do this as well
 - Players who have guns out (including Rocco) can shoot while moving in the ripple (unlike standard dash)
 - The ripple lasts on the field for 4 seconds
 - For now, the ripple should be demarcated by a short series of rings, following the path of the ripple. The starting ring should be a different color, in order for it to be clear where to "take" the ripple
 - When the 4 second timer is up, all effects and visuals of the ripple should disappear.

Chut (character b)

- Chut's knife deals 50 damage from the front (passive)
- Chut can bash players by hitting them with the end of his standard dash, knocking them in the direction he is moving (movement).
 - This does not have any effect on the core carrier
 - Dashing through a trace still kills the carrier
 -

- Activated ability: Chud
 - Chud takes 30% less damage from body shots and melees for 10 seconds
 - This timer refreshes when Chud kills an enemy with a knife
 - This damage reduction does not stack
 - 20 second cooldown

Mace

- Mace has a 30% greater radius to the “magnet” zone where the core arcs to her (passive)
- Mace can suspend herself in the air for up to 1.25seconds by holding V while in the air
 - Mace can move laterally while holding her suspend, but gravity does not affect her for that time
 - Lateral movement while holding V is capped at walking speed of 550
 - When V is released, the suspension is immediately cancelled, and gravity begins to affect her
- Activated ability: Spike
 - Mace throws a rope with a spike on the end, which travels in the direction she is aiming for a medium distance.
 - If Spike hits a wall, it embeds itself in the wall for 2 seconds
 - Mace can reactivate Spike while it is embedded to pull herself towards it
 - If Mace inputs movement while being pulled, the Spike disappears and her movement overrides the “pull”
 - The pull happens at the speed of the momentum ceiling
 - Mace obeys normal physics while being pulled (e.g. she will bounce off walls, cancelling the pull, etc.)
 - Mace can be shot while in her pull. Mace can shoot while in her pull

Oyster

- Oyster leaves behind poison jars when he dashes (passive)
 - These spawn at the beginning of his dash, whenever he uses the ability, including if he has the core
 - When an enemy hits a jar, it breaks, dealing poison damage to any nearby enemies
 - Oyster’s poison deals 3 damage every .5 seconds, lasting for 4 seconds
 - Oyster’s poison slows enemies by 30% for 4 seconds
 - Jars last on the ground for 4 seconds
 - No more than three jars can exist at once (if a fourth one spawns, the oldest one despawns)
- Oyster can jump while on top of one of his poison jars, breaking the jar and boosting him upwards
- Activated ability: Pickler

- Oyster lob a jar into the air, which deals 30 damage in an area around it when it lands, pulling enemies towards it within a small radius
- The jar does not explode upon landing, it is the same as his other jars, which stay behind for a short period of time until broken

X

- X is constantly orbited by five tiny mechanical bees (passive)
 - When an enemy is hit by a bee, they become vulnerable for 2 seconds, taking 25% more damage from all sources
 - Vulnerable doesn't stack, but new instances of vulnerable being applied reset the timer
- X gets a 10% speed boost as long as an enemy is vulnerable (movement)
- Activated ability: Sting
 - X loads his gun with his 5 bees, which no longer orbit around him
 - His next five bullets apply vulnerable when they hit an enemy
 - These bullets do the same damage as the gun normally does
 - Once he fires all five bullets, his bees begin orbiting him once again
 - Has a 25 second cooldown
