

Changes:

Remove boost from the game entirely

Ensure that, when the core is turned over to the opposite team, there is a .4second grace period before the trace begins spawning

Replace character models with default unreal engine human character models that have running animations, heads, and limbs

Slightly increase efficacy of strafing in mid air

Update the movement system with these specific behaviors, mimicking apex legends movement and source engine :

1. Air acceleration: player retains full control authority to redirect velocity in air, capped at `air_accel = [X]`. Perpendicular-to-velocity input should turn the player without reducing speed, per Source-style air control.
2. Landing: do not clamp horizontal velocity to ground max speed on landing. Velocity carries over from air to ground.
3. Slide: entry speed determines slide velocity (no flat momentum boost). Add a [X]s cooldown between slides.
4. State transitions (run→jump, jump→slide, slide→jump) should preserve velocity vectors rather than resetting them.

Don't worry about matching Apex exactly — implement these as tunable variables (accel caps, friction, slide multiplier) so I can playtest and adjust numbers rather than you guessing at "feel."

Reduce trail lifetime to 2.00

Have the slide increase momentum, add a .8second buffer between slides

Create a parry mechanic for the core carrier. Parrying gives your trace invulnerability for .1seconds. It also makes the entire trace turn red for the duration of the parry. If an enemy would break your trace with a dash, parrying as they dash protects the trace.

Passing is inconsistent on this version, and it wasn't on the last; sometimes the pass option doesn't show up. There's still no crosshair in third person.

Shooting feels WAY more inconsistent on this latest version. Please double check the code for both shooting and passing.

Do a second pass of the entire project to ensure consistent and workable code and to reduce bugs

Map:

Use this overhead view as a very simple basis for generating the default map template:

Length : width :: 2:5:1

Key: Green arrow = Slants down in the direction of the arrow

Blue fill = Blue endzone

Red fill = Red Endzone

Grey Box with green outline = structure 1x player height tall

Grey Box with Orange outline = structure 2x player height tall

Grey Box with red outline = Structure 3.5x player height tall
