

Bot Fixes:

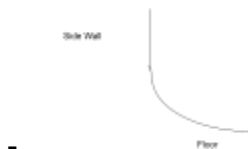

- Bots in this version, even on hard, very very rarely dash through the trace.
 - They run at the carrier, following the exact motion (eg direction turned) of the carrier and stand by it

Bugs:

- The carrier still has only one dash, despite the hud showing two. When the first refills, they both do. When dash is used, both charges are consumed.
- When a player passes/throws the core, it takes a second for their trace to disappear, and they can still be killed. The trace should disappear the instant a pass/throw is made.
- Also, there is a new bug in this version where traces stay on the map way after the carrier is dead or has made a pass

Changes:

- Wall jumping
 - Reduce momentum gained from wall jumping by 10%
 - Right now it feels like the player is sticking to the wall for a second: Make the window of time for performing a wall jump shorter and make the action happen faster
 - If a player inputs a wall jump, that overrides a mantle
- Reduce max slide length by 30%
- Increase the bonus of timing a slide jump right by 30%
- The movement is feeling good, but its a bit too floaty. Move the asymptote on momentum slightly higher, to allow for slightly faster speeds.
 - Increase gravity by 12%, to make players feel less floaty when air strafing.
- Set default startup bot difficulty to normal
- Curve the corners of the arena walls, so that the crosssection of the arena looks something along these lines:

- Change halftime to trigger after the time runs out *and* the current play ends, so that it doesn't cut people off in the middle of a run E.g. the ball drops in game mode b, any turnover of the core happens between teams, or a goal is scored, then half time triggers.
