

Changes

- You can remove the slideexitminsppedfraction value, as well as any other part of the slide code contradicting the movement list. The flat momentum boost should be ruled out, going with the source-style movement system instead.
- Sliding, however, doesn't feel like it does much; is it possible to add a slide-jump mechanic, also attempting to feel like apex legends. The current movement system is definitely on the right track, and the air strafing mechanisms feel like source movement, which is good. If unreal has a default slide animation for the mannequins, please add that in.
- Change the look of the trace to match the new mannequin models, rather than the old cylinder models.
- Lengthen the map to a 3.5:1 ratio, adjusting the structures to match.
- Remove the sphere from the end of the bullet tracer hitscan animation, so it's just a bullet trace, which makes it easier to see where your shots are going. Reduce the radius of the cross section of the bullet tracers in order to make them thinner.
- Reduce respawn time from 3seconds to 2seconds
- Increase time before trace starts spawning on turnovers by 1.25x
- Reduce walking speed to 800.00
- Remove score to win 5
 - Keep the match timer as the win condition, but add a mercy rule, where the game will end if one team leads by 8 points (granting an immediate win to the team leading).

Testing Different version of scoring

- Create a toggle which can switch between the current game state(a) (endzones + core is a status) to a game state (b) where the core can be thrown and intercepted, so that we can test which feels better.
 - Game state b should have goals *instead* of endzones, and scoring should happen when the core is thrown into the goal or a player carries the core into the goal. The goal should *not* be the entire width of the map, like the endzone.
 - In game state b, the core should be a physical entity that can be thrown and picked up. The carrier should be able to throw the core forward by left clicking. The first player to contact the core should pick it up.
 - Turnovers in game state b should retain the grace period from game state a. However, teammates picking up the core should not have a grace period, the same as when they are passed to in game state a
