

- When a player stands still, their trace is gone and they can't be killed. Make it so the trace only disappears based on new trace spawning (e.g. a value for trail length), rather than a timer, in order to solve this problem. This shouldn't affect anything else at all.
- Lower the value of trail length (converted from trail time) by 25%.
- Get rid of the top and bottom third of the trace, so that it's just the middle section, in order to make visibility around the trace better. That's what I meant by tron trail coming out the back. Also reduce the width, it doesn't need to be the full width of the player model.
- Bug: Sometimes the core gets stuck up top of an object in gamemode b. This should also count as a turnover. Walls should not, the core should bounce off those.
- Vectorize dashes:
 - If only A or D is held, dash horizontally only: parallel to the ground
 - If W or S is held, dash with relation to mouse aim direction (ie if the player is pointing the mouse up, dash vertically, or if the player is pointing 45 degrees from the ground, dash that direction)
 - If both W or S and A or D is held (W and D, W and A, etc) add the two vectors and normalize to one dash length to find player dash direction
- When a player carrying the trace successfully kills an enemy with a parry, reset that players parry cooldown to zero and one of their dash cooldowns to zero. If the first dash is already off cooldown, the second one should be set to zero instead.
- Bug: For the player joining the server, on 40 ping, there are issues with the way their character's trace appears. The far end of the trace seems to be pulled back towards their character model, so that both ends of the trace are tied to the character instead of just the most recent part of the trace.
