

- Remove all of the player models which you implemented, and revert them to the default mannequins. The third person view models are extremely messed up, teleporting around and stretching at extreme angles. It's impossible to shoot at anyone.
- I need to test this first person arms rig i created. See if you can animate it to hold the knife and guns correctly. The ring fingers bend opposite the rest, so you'll have to invert that. Implement this only in the practice range, for testing purposes.
- Ensure the core begins each half on top of the octagon, the newly added pillar which lies in the middle of the map. Teams must climb up in order to retrieve it. After a goal, the core spawns in front of the team who was scored on's goal, with the scoring team locked out.
- Currently, when sliding down the curved surfaces, a player loses all momentum at the end of the curve. This is extremely unintuitive. A player should carry momentum from a curve down onto the flat floor. It still doesn't feel like you can "surf" into curves/ curved ramps in order to gain momentum
- Revert X's bees to the old model
- Remove the character card portraits
- Make Roxie's rocket hit radius match the model, but it should only do 100 damage for direct impacts. Otherwise, the damage should fall off
- Can you explain what it means that the rails are on the procedural arena and not default matches?
- Revert the kill noise to my old one

- Can you create a list of all the sounds in the game with playable samples next to each action, so that I can go through and test every single one added and replace specific ones?
- Random beeps play sometimes with no clear trigger
